

Kevin Fairgrieve - Mk2

After the first round of the Hanky Planky Wacky Races, I decided that I would make a second model. I do not expect the first to survive the season.

When I built the first one from Ron`s kit it was my first Depron build (and maybe my last).

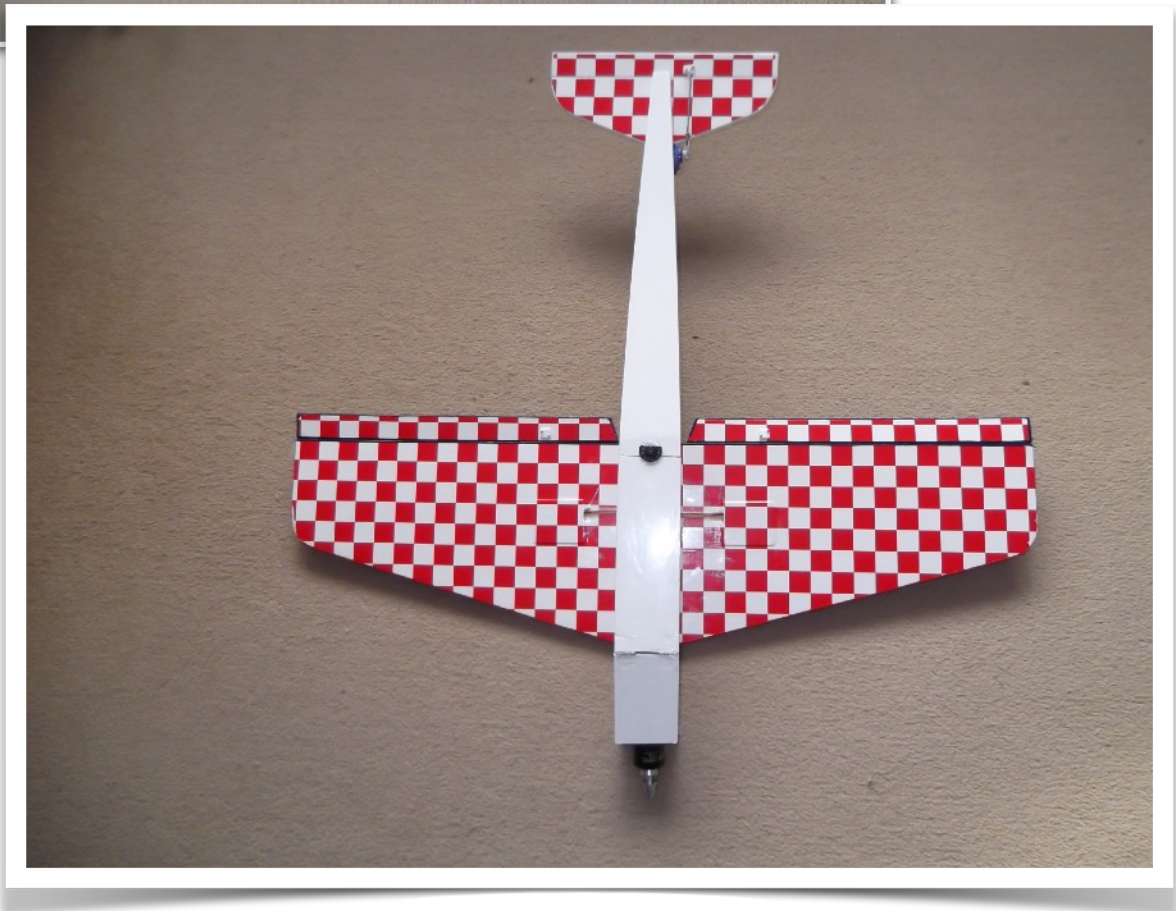

So I pulled the original plan from the RCM&E and cut all the wood as per the original, with one exception.

Many people seem to be having some success with the KFM2 airfoil. I decided on different and went with my own version of the KFM3.

The steps should be 50% and 75%, my version still used the 50% but is nearer 62% for the second section. Time will tell if it works.

All up weight is a bit more than the Depron version at 615grams. I also think that some church roof will be required to achieve the correct CofG.
